

GE MRI AUTO PRE-SCAN BACKEND SEQUENCE

THE TRUE HARDWARE-ACCURATE SEQUENCE AFTER YOU CLICK **SAVE RX AND SCAN**

THE FINAL HANDSHAKE

Once Phase 6 clears, the backend writes all calibrated parameters into the current scan's active memory profile:

The Prescan progress bar disappears, the computer switches from calibration mode to imaging mode, and the Gradient Power Amplifiers receive the instruction to begin execution of the full imaging pulse sequence.

KEY TAKEAWAY

The Auto Prescan is not a single action—it is a rapid, six-phase calibration handshake between the software and the hardware. It optimizes the magnetic field, RF system, and electronics to ensure the best possible image quality and patient safety.

Accurate Prescan → Optimal Image Quality → Patient Safety
